Solution

Feasible Integral Solution

Instance

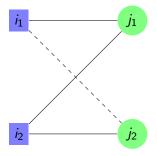

Solution

Cost

$$2f_1 + f_2 + 3f_3 + d_{11} + d_{12} + 2d_{14} + d_{23} + 3d_{31} = 38$$

Metric Distances: Triangle Inequality

$$d(i_1, j_2) \le d(i_1, j_1) + d(i_2, j_1) + d(i_2, j_2)$$

Needed when estimating distances...

- Results in Dissertation

- 6 Approximation Algorithms

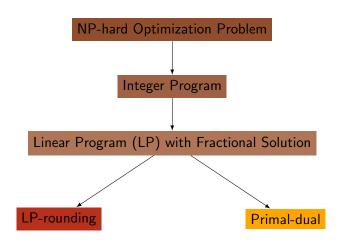

Hardness

How hard is FTFP?

FTFP is NP-hard

FTFP is MaxSNP-hard

Best ratio ≥ 1.463 unless P = NP

Results Highlight

- LP-rounding: 1.575-approximation
- LP-rounding: asymptotic ratio of 1 when all demands large
- Primal-dual: H_n -approximation
- Primal-dual: Example of $\Omega(\log n / \log \log n)$ for dual-fitting

$$\begin{array}{ll} \mathsf{FTFP} & r_j \geq 1 & <\infty \text{ facility per site} \\ \mathsf{UFL} & r_j = 1 & \leq 1 \text{ facility per site} \\ \mathsf{FTFL} & r_j \geq 1 & \leq 1 \text{ facility per site} \end{array}$$

Table of Contents

- Techniques

Techniques

Demand Reduction

- Reduce all r_i to polynomial values (to ensure polynomial time of rounding)
- ρ -approx for reduced instance $\Rightarrow \rho$ -approx for original instance

- Split sites into facilities and clients into unit demands
- Split associated fractional values
- Properties ensure rounding similar to UFL can be applied

LP Formulation for FTFP

- y_i = number of facilities open at site $i \in \mathbb{F}$
- $x_{ij} =$ number of connections from client $j \in \mathbb{C}$ to site $i \in \mathbb{F}$

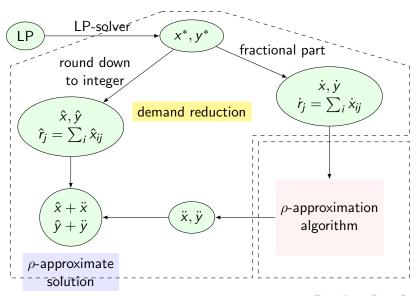

(Primal) minimize
$$\sum f_i y_i + \sum d_{ij} x_{ij}$$

subject to $y_i - x_{ij} \ge 0$ $\forall i, j$
 $\sum x_{ij} \ge r_j$ $\forall j$
 $x_{ij} \ge 0, y_i \ge 0$ $\forall i, j$

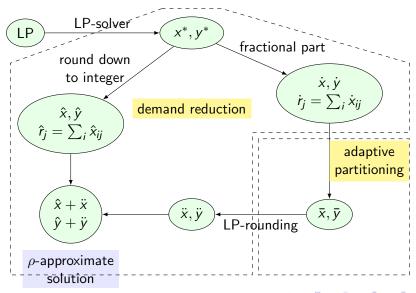

(Dual) maximize
$$\sum r_j \alpha_j$$

subject to $\sum \beta_{ij} \leq f_i \quad \forall i$
 $\alpha_j - \beta_{ij} \leq d_{ij} \quad \forall i, j$
 $\alpha_j \geq 0, \beta_{ij} \geq 0 \quad \forall i, j$

Algorithm for FTFP

Algorithm for FTFP

Techniques

Demand Reduction

- Reduce all r_i to polynomial values (to ensure polynomial time of rounding)
- ρ -approx for reduced instance $\Rightarrow \rho$ -approx for original instance
- Adaptive Partitioning
 - Split sites into facilities and clients into unit demands
 - Split associated fractional values
 - Properties ensure rounding similar to UFL can be applied

Demand Reduction

Implementation

- Solving LP for $(\mathbf{x}^*, \mathbf{y}^*)$.
- $(\hat{\mathbf{x}}, \hat{\mathbf{y}}) = (\mathbf{x}^*, \mathbf{y}^*)$ round down to integer
- $(\dot{\mathbf{x}},\dot{\mathbf{y}})=(\mathbf{x}^*,\mathbf{y}^*)-(\hat{\mathbf{x}},\hat{\mathbf{y}})$, fractional part
- $\hat{r}_j = \sum_j \hat{x}_{ij}$ for $\hat{\mathcal{I}}$, $\dot{r}_j = r_j \hat{r}_j$ for $\dot{\mathcal{I}}$
- ullet $(\hat{\mathbf{x}},\hat{\mathbf{y}})$ (integral) feasible and optimal for $\hat{\mathcal{I}}$
- ullet (\dot{x},\dot{y}) (fractional) feasible and optimal for $\dot{\mathcal{I}}$

Properties

- $\dot{r}_i = \text{poly}(|\mathbb{F}|)$
- ρ -approx for $\dot{\mathcal{I}}$ implies ρ -approx for \mathcal{I}

Demand Reduction: Consequences

FTFP to FTFL, 1.7245-approximation

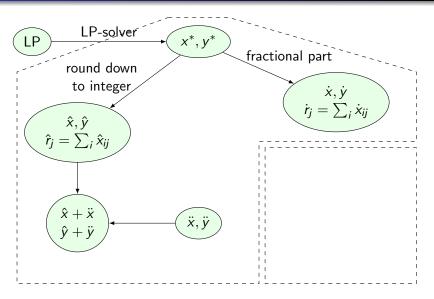

- Sites into facilities
- Clients with demand r_i
- FTFL size polynomial because demand reduction

Ratio
$$1 + O(|F|/Q)$$
 for $Q = \min_j r_j$, approaches 1 when Q is large

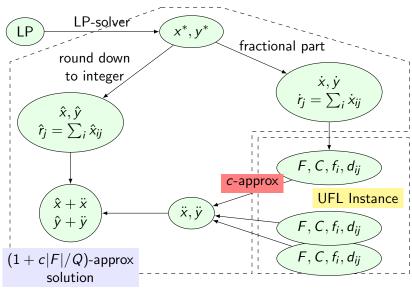

Next slide

Ratio 1 + O(|F|/Q) for FTFP

Adaptive Partitioning

Neighborhood of Demand

Neighborhood of Demand

ν needs 1 facility...

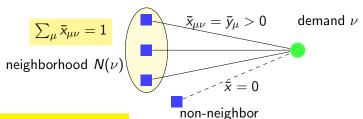

Strategy 1: for each ν , open one $\mu \in N(\nu)$ with prob. \bar{y}_{μ}

- optimal connection cost
- large facility cost

Strategy 2: do this for demands with disjoint neighborhoods

- optimal facility cost
- large connection cost

Neighborhood of Demand

ν needs 1 facility...

Strategy 1: for each ν , open one $\mu \in N(\nu)$ with prob. \bar{y}_{μ}

- optimal connection cost
- large facility cost

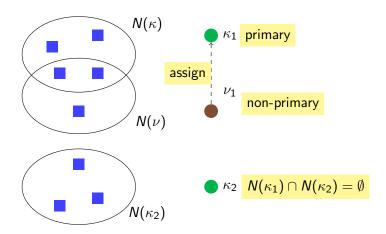

Strategy 2: do this for demands with disjoint neighborhoods

- optimal facility cost
- large connection cost

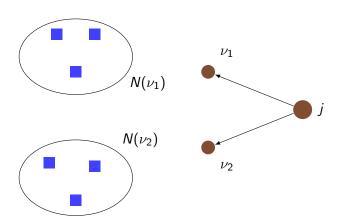

How to balance these two strategies?

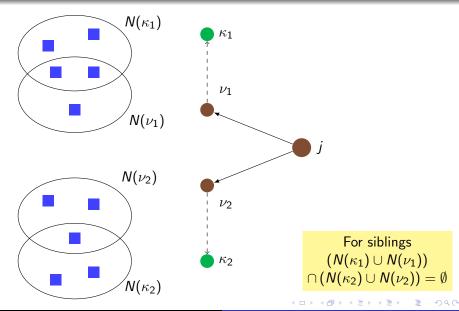

Two Types of Demands: Primary and Non-primary

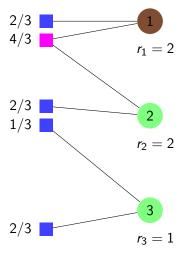

Neighborhood Structure for Siblings

Neighborhood Structure for Siblings

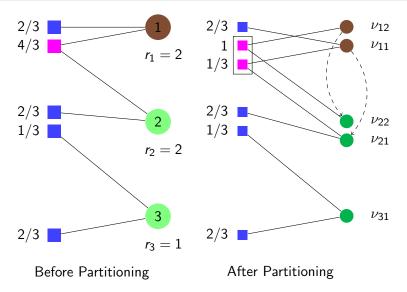

Example of Partitioning

Before Partitioning

Example of Partitioning

Partitioning:

- Clients → demands
- Sites → facilities
- $(x^*, y^*) \rightarrow (\bar{x}, \bar{y})$
- $\bullet \sum_{\mu} \bar{x}_{\mu\nu} = 1$
- $\bar{x}_{\mu\nu} = \bar{y}_{\mu}$ or 0

Structure:

• If κ_1, κ_2 primary then $N(\kappa_1) \cap N(\kappa_2) = \emptyset$

- Each non-primary ν assigned to κ with
 - $N(\kappa) \cap N(\nu) \neq \emptyset$
 - priority(κ) < priority (ν)

• $N(\kappa_1) \cup N(\nu_1) \cap N(\kappa_2) \cup$ $N(\nu_2) = \emptyset$

Partitioning:

- Clients → demands
- Sites → facilities
- $\bullet \ (x^*,y^*) \to (\bar{x},\bar{y})$
- $\sum_{\mu} \bar{x}_{\mu\nu} = 1$
- $\bar{x}_{\mu\nu} = \bar{y}_{\mu}$ or 0

Structure:

• If κ_1, κ_2 primary then $N(\kappa_1) \cap N(\kappa_2) = \emptyset$

small facility cost

- Each non-primary ν assigned to κ with
 - $N(\kappa) \cap N(\nu) \neq \emptyset$
 - priority(κ) \leq priority (ν)

• $N(\kappa_1) \cup N(\nu_1) \cap N(\kappa_2) \cup N(\nu_2) = \emptyset$

Partitioning:

- \bullet Clients \rightarrow demands
- Sites → facilities
- $\bullet \ (x^*,y^*) \to (\bar{x},\bar{y})$
- $\bullet \ \sum_{\mu} \bar{x}_{\mu\nu} = 1$
- $\bar{x}_{\mu\nu} = \bar{y}_{\mu}$ or 0

Structure:

• If κ_1, κ_2 primary then $N(\kappa_1) \cap N(\kappa_2) = \emptyset$

small facility cost

- Each non-primary ν assigned to κ with
 - $N(\kappa) \cap N(\nu) \neq \emptyset$
 - priority(κ) \leq priority (ν)

small connection cost of ν

• $N(\kappa_1) \cup N(\nu_1) \cap N(\kappa_2) \cup N(\nu_2) = \emptyset$

Partitioning:

- \bullet Clients \rightarrow demands
- Sites → facilities
- $(x^*, y^*) \rightarrow (\bar{x}, \bar{y})$
- $\sum_{\mu} \bar{x}_{\mu\nu} = 1$
- $\bar{x}_{\mu\nu} = \bar{y}_{\mu}$ or 0

Structure:

• If κ_1, κ_2 primary then $N(\kappa_1) \cap N(\kappa_2) = \emptyset$

small facility cost

- Each non-primary ν assigned to κ with
 - $N(\kappa) \cap N(\nu) \neq \emptyset$
 - priority(κ) \leq priority (ν)

small connection cost of ν

• $N(\kappa_1) \cup N(\nu_1) \cap N(\kappa_2) \cup N(\nu_2) = \emptyset$

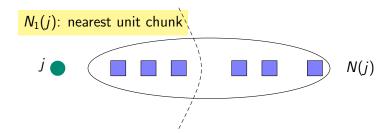

fault-tolerance

Partition Implementation

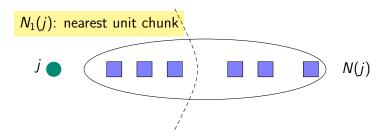

Partition implementation: two phases

- Phase 1, the partitioning phase
 - Define demands
 - Allocate facilities
- Phase 2, the augmenting phase
 - Add facilities to make neighborhood unit

In each iteration, create one demand for best client

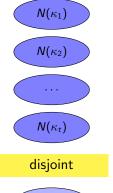

In each iteration, create one demand for best client

- $\mathsf{bid}(j) = \mathsf{avgdist}(N_1(j)) + \alpha_i^*$
- Best bid client p creates a demand
- Two cases, depending on $N_1(p)$

Selected best client p, two cases:

 $N_1(p)$

Case 1

 $N_1(p)$ overlaps some $N(\kappa)$

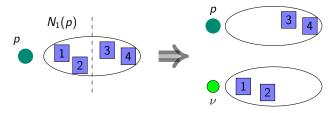

Case 2

Best client p creates demand ν , to decide $N(\nu)$, two cases:

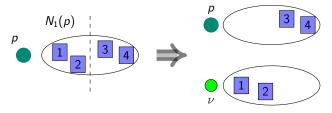

Best client p creates demand ν , to decide $N(\nu)$, two cases:

• Case 1: disjoint, $N(\nu)$ gets $N_1(p)$

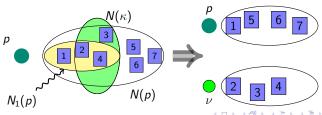

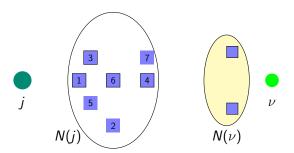

Best client p creates demand ν , to decide $N(\nu)$, two cases:

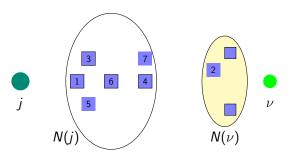

• Case 1: disjoint, $N(\nu)$ gets $N_1(p)$

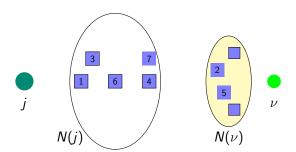

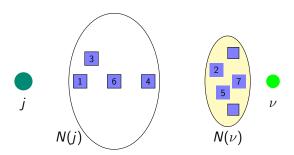

• Case 2: overlap, $N(\nu)$ gets $N(p) \cap N(\kappa)$

We are done with adaptive partitioning

Got a structured fractional solution

We are done with adaptive partitioning

Got a structured fractional solution

Next: the rounding algorithms...

Table of Contents

- 6 Approximation Algorithms

3-Approximation for FTFP

Rounding

- Facilities: each primary κ opens one $\mu \in N(\kappa)$
- Connections: non-primary demands ν assigned to κ connect to μ

Analysis

- Fault-Tolerance: ν uses only facilities in $N(\nu) \cup N(\kappa)$
- Cost: $< 3 \cdot LP^*$, because
 - Facility cost < F*
 - Connection cost $< C^* + 2 \cdot LP^*$

Rounding

- Facilities:
 - Each primary κ opens random $\mu \in N(\kappa)$
 - Other facilities open randomly independently
- Connections:
 - If a neighbor open, connect to nearest neighbor
 - Else connect via assigned primary demand

Analysis

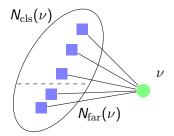

- Fault-Tolerance: ν uses only facilities in $N(\nu) \cup N(\kappa)$
- Cost: $< (1+2/e) LP^*$, because
 - Facility cost < F*
 - Connection cost $\leq C^* + (2/e) \cdot LP^*$

1.575-Approximation for FTFP — Partitioning

More intricate neighborhood structure

- Two neighborhoods: close and far, $N(\nu) = N_{\rm cls}(\nu) \cup N_{\rm far}(\nu)$
- $N_{\rm cls}(\nu) = \text{nearest } (1/\gamma) \text{fraction of } N(\nu)$
- $N_{\rm cls}(\nu) \cap N_{\rm cls}(\kappa) \neq \emptyset$, if ν assigned to κ
- For siblings $\nu_1, \nu_2, N_{\rm cls}(\kappa_1) \cup N(\nu_1)$ and $N_{\rm cls}(\kappa_2) \cup N(\nu_2)$ disjoint

1.575-Approximation for FTFP — Rounding

Rounding: boost $(\mathbf{x}^*, \mathbf{y}^*)$ by γ and use for demand reduction and adaptive partitioning, then

- Facilities:
 - Each primary κ opens random $\mu \in N_{cls}(\kappa)$
 - Other facilities open randomly independently
- Connections:
 - If a neighbor open, connect to nearest neighbor
 - Else connect via assigned primary demand

Analysis

- Fault-Tolerance: ν uses only facilities in $N(\nu) \cup N_{\rm cls}(\kappa)$
- Cost: $\langle \gamma \cdot LP \text{ for } \gamma = 1.575, \text{ because} \rangle$
 - Facility cost $< \gamma \cdot F^*$
 - Connection cost $< \gamma \cdot C^*$

- Greedy in polynomial time
 - Best star can be found quickly
 - Best star remains best
- Ratio H_n (Wolsey's result): Greedy is H_n -approx for
 - Minimizing a linear function
 - Subject to submodular constraints
- Lower bound $\Omega(\log n/\log\log n)$ for dual-fitting
 - Example has k groups, $n = k^k$
 - Shrinking factor is k/2

Dual feasibility forces a ratio of k/2, number of clients $n = k^k$
